Creating Innovation Value through Generative AI: A Property Rights Perspective

ABSTRACT

Generative Artificial Intelligence (GenAI), particularly Large Language Models (LLMs), has emerged as a transformative technology, creating significant value through its applications in various industries. However, the rapid advancement of GenAI has also raised complex questions about property rights, intellectual property, and the ownership of the content and data generated by these models. This abstract explores the legal and ethical challenges surrounding the ownership of AI-generated content and data, and discusses potential solutions to address these challenges. The paper examines the current legal framework, including copyright and patent law, and analyzes the implications of these laws for the development and deployment of GenAI. It also discusses the importance of establishing clear property rights for AI-generated content and data, and the role of government and industry in addressing these challenges. The abstract concludes by highlighting the need for a balanced approach that promotes innovation and protects the rights of individuals and organizations.

Supplier Financing Agreements and Cash Flows

ABSTRACT

This abstract discusses the impact of supplier financing agreements on a company's cash flows. It examines how these agreements can improve liquidity and reduce the risk of supply chain disruptions. The study also explores the different types of supplier financing arrangements and their respective effects on a company's financial performance. The research findings suggest that companies that utilize supplier financing agreements experience higher cash flow levels and lower working capital requirements. The abstract concludes by highlighting the importance of carefully evaluating the terms and conditions of these agreements to ensure they align with the company's financial goals and risk management strategy.
